**DEMO · SIMULATED**

| 5 | 5 | 117 | 12 | 0 |
|---|---|---|---|---|
| Draws sealed | Completed | Chain records | Anchors submitted | On Bitcoin |

## FROM ENTRY TO WINNER

### Chained audit trail

Every entry confirmation is written to an append-only, per-draw hash chain. Each record stores the hash of the previous one; database triggers reject updates and deletions, so any alteration is detectable.

### Sealed draw hashes

At close the final chain hash and record count are sealed. Appends to a sealed chain are rejected; anyone can recompute the chain from the public, privacy-masked chain file.

### OpenTimestamps Bitcoin anchoring

Seed commitments and seals are submitted (as SHA-256 digests only) to public OpenTimestamps calendars and later upgraded to Bitcoin attestations. Optional RFC 3161 TSA tokens are supported.

### Delayed seed reveal (commit–reveal)

A 256-bit server seed is generated at opening; only SHA-256(seed) is published. No page, API, log, email or export reveals the seed before the draw is sealed and run.

### Crowd randomness + external beacon

Final seed = HMAC-SHA256(serverSeed, SHA-256(crowd entropy || drand beacon) || seal hash). Crowd entropy comes from all receipt codes; the beacon round is fixed at seal, so neither operator nor entrants can grind outcomes.

### Entry confirmations & receipts

Each entry produces a non-guessable receipt code (80 random bits) and an emailed proof of entry; a public, rate-limited page verifies a receipt and its place in the sealed chain.

### Reminder logging

Every reminder decision (sent or skipped: at cap, closed, opted out, unsubscribed, failed) is logged once per member, draw and type, and exportable.

### Winner notification

Winners receive a notification with the one-page Fairness Report PDF attached. Delivery, demo opens, resends, visibility changes and report downloads are logged.

### Public one-click verification

The verify page re-runs, in the visitor's browser, the chain, seal, anchor, commitment, seed derivation and winner selection using the same open-source engine as the server.

### Privacy

Public pages show masked names only (e.g. “A*** M.”); emails are never published. Identities in the public chain are salted SHA-256 commitments. Raw IP addresses are not stored; where needed (report downloads, rate limiting) only a keyed hash is kept or the value is held in memory. Open tracking is off by default and only possible with SMTP when explicitly enabled.

### Unsubscribe & opt-out

Every reminder carries a one-click unsubscribe link (no login, RFC 8058 List-Unsubscribe headers) honoured immediately. Members can opt out of all or only short-notice reminders in their dashboard. All changes are logged with time and method.

LuckyDraw is a demonstration platform: all money, deposits, entry fees and prizes are simulated. This summary describes technical mechanisms; it is not legal advice or a certification. Organizers remain responsible for complying with local lottery, raffle and sweepstakes law and licensing.
