| Closed (UTC) | 2026-10-20 10:19:07 |
| Sealed (UTC) | Not yet sealed |
| Entries / chain records | 16 entries · — confirmation records |
| Sealed final hash | `Not yet sealed` |
| Seed commitment | `07c1d06abfb46827ff5723a554b83652a560c5d9ec4f55cba9838d731e8afe28` |
| Server seed | `Withheld until seal` |
| Crowd entropy | `Computed at the draw from all receipt codes` |
| Beacon | `Committed at seal` |
| Final seed | `Derived at the draw` |
| Anchor | Not yet anchored |
| Winning number | Not yet drawn |

## HOW THIS DRAW IS PROTECTED

### Chained audit trail

Every entry confirmation is appended to a per-draw hash chain: each record stores the hash of the previous one, so any edit, deletion or reordering changes every later hash.

### Sealed draw hash

When entries close, the final chain hash and record count are sealed. No record can be added afterwards, and anyone can recompute the chain from the public file and compare.

### OpenTimestamps Bitcoin anchor

The seal digest is submitted to public OpenTimestamps calendars, which commit it into the Bitcoin blockchain. The .ots proof shows the seal existed no later than that block.

### Delayed seed reveal

A secret server seed is generated at opening and only its SHA-256 commitment is published. The seed is revealed after the seal, proving it was fixed before any entry.

### Crowd randomness + external beacon

The final seed is HMAC-SHA256(serverSeed, SHA-256(crowd entropy || drand beacon) || seal hash). Crowd entropy comes from all receipt codes; the beacon round is fixed at seal and did not yet exist, so neither the operator nor the last entrant can grind the result.

### Verify independently

Open the verify page to recompute the chain, seal, anchor, seed derivation and winner in your browser. Proof files: .ots (verify with `ots verify` or opentimestamps.org).
